

Exercise 3: More SQL Fundamentals

In this exercise you will practice a bit more Advanced SQL queries to retrieve data from a database.

1. Start by accessing your MySQL Workbench instance and connect to the MySQL Connection you created when installing MySQL.
2. Open the file `music_store_db_dump.sql` provided in the HW3 and execute it (click the Thunder). This will generate a new schema (database) called `musicstore` and insert all the data needed for the exercise.
3. Open the file `hw3.sql` and follow the instructions there. Write each of the SQL queries below the question.
4. Once you have finished with the exercise, rename it as `hw3_name_surname.sql`.
5. Connect to the server from hw1 (IP: 54.246.165.23). Remember you can connect to a remote server by using the command `ssh (ssh <name_surname>@54.246.165.23)`
6. Create a folder in the server named `hw3`.
7. Copy the file `hw3_name_surname.sql` into the `hw3` folder in the server. Remember to copy the file by executing the required command from your computer, not from the server.
